

PowerPC 405EP Embedded Processor Data Sheet

Features

- IBM PowerPC® 405 32-bit RISC processor core operating up to 266MHz with 16KB D- and I-caches
- PC-133 synchronous DRAM (SDRAM) interface
 - 32-bit interface for non-ECC applications
- 4KB on-chip memory (OCM)
- External peripheral bus
 - Flash ROM/Boot ROM interface
 - Direct support for 8- or 16-bit SRAM and external peripherals
 - Up to five devices
- DMA support for memory and UARTs.
 - Scatter-gather chaining supported
 - Four channels
- PCI Revision 2.2 compliant interface (32-bit, up to 66MHz)
 - Asynchronous PCI Bus interface
 - Internal or external PCI Bus Arbiter
- Two Ethernet 10/100Mbps (full-duplex) ports with media independent interface (MII)
- Programmable interrupt controller supports seven external and 19 internal edge triggered or level-sensitive interrupts
- Programmable timers
- Software accessible event counters
- Two serial ports (16750 compatible UART)
- One IIC interface
- General purpose I/O (GPIO) available
- Supports JTAG for board level testing
- Internal processor local Bus (PLB) runs at SDRAM interface frequency
- Supports PowerPC processor boot from PCI memory

Description

Designed specifically to address embedded applications, the PowerPC 405EP (PPC405EP) provides a high-performance, low-power solution that interfaces to a wide range of peripherals by incorporating on-chip power management features and lower power dissipation requirements.

This chip contains a high-performance RISC processor core, SDRAM controller, PCI bus interface, Ethernet interface, control for external ROM and peripherals, DMA with scatter-gather

support, serial ports, IIC interface, and general purpose I/O.

Technology: IBM CMOS SA-27E, 0.18 μm (0.11 μm L_{eff})

Package: 31 mm, 385-ball, enhanced plastic ball grid array (E-PBGA)

Power (typical): 1.2W at 200MHz

PPC405EP	IBM25PPC405EP-3GB266C	266MHz	31 mm, 385 E-PBGA	B	0x51210950	0x20267049
PPC405EP	IBM25PPC405EP-3GB266CZ	266MHz	31 mm, 385 E-PBGA	B	0x51210950	0x20267049

Note 1: Z at the end of the Order Part Number indicates a tape and reel shipping package. Otherwise, the chips are shipped in a tray.

The part number contains a part modifier. Included in the modifier is a revision code. This refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only.

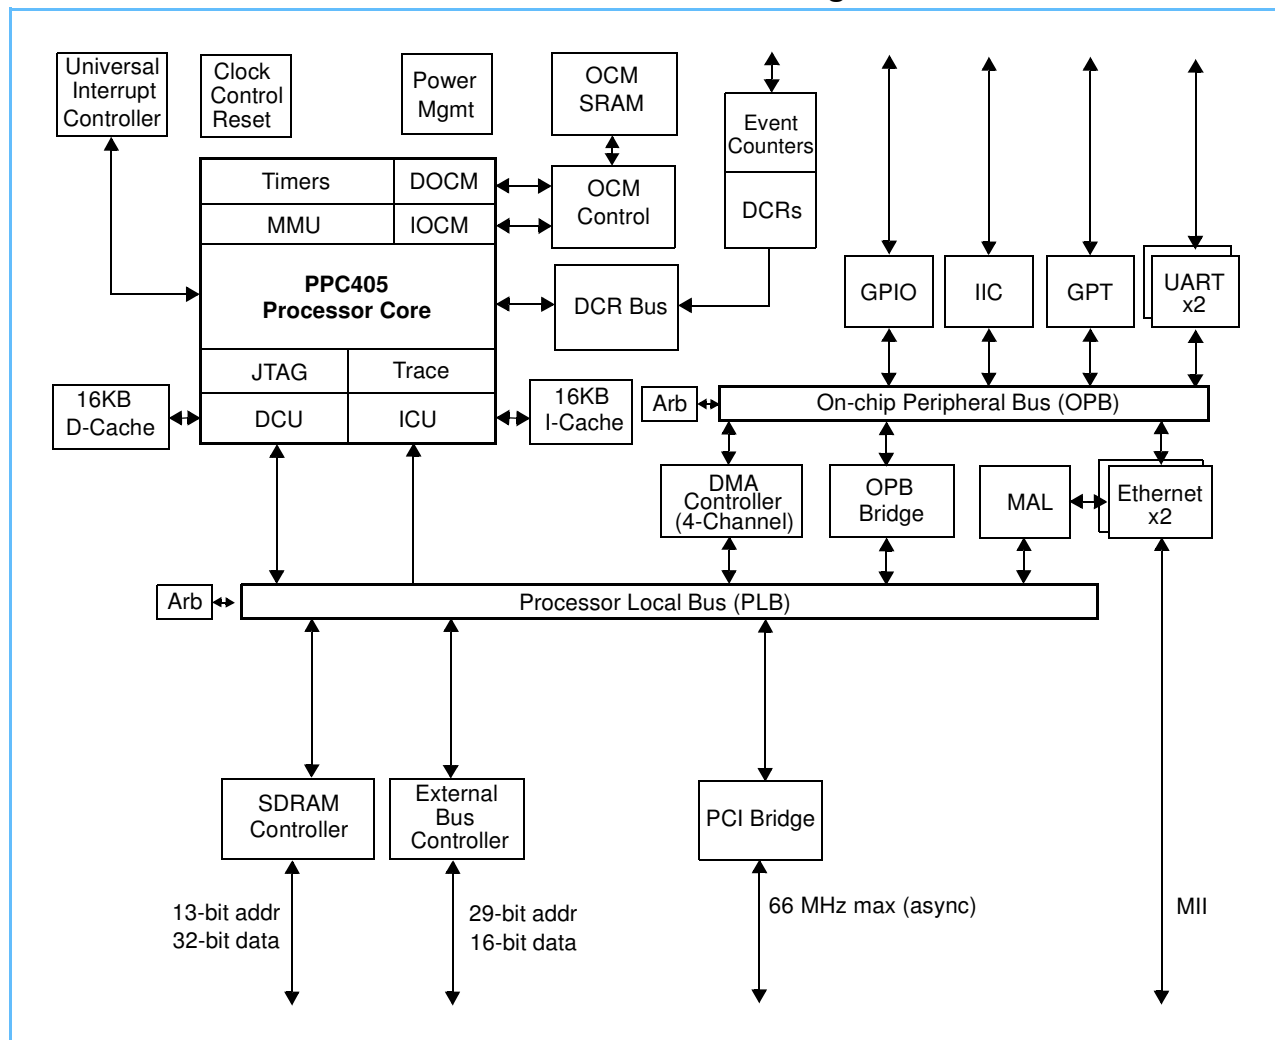

The PVR (Processor Version Register) and the JTAG ID register are software accessible (read-only) and contain information that uniquely identifies the part. Refer to the *PowerPC 405EP Embedded Processor User's Manual* for details on accessing these registers.

Order Part Number Key

PowerPC 405EP Embedded Processor Data Sheet

PPC405EP Embedded Controller Functional Block Diagram

The PPC405EP is designed using the IBM Microelectronics Blue Logic™ methodology in which major functional blocks are integrated together to create an application-specific ASIC product. This approach provides a consistent way to create complex ASICs using IBM CoreConnect™ Bus Architecture.

PowerPC 405EP Embedded Processor Data Sheet

Address Map Support

The PPC405EP incorporates two address maps. The first address map defines the possible use of addressable memory regions that the processor can access. The second address map defines Device Configuration Register (DCR) addresses (numbers). The DCRs are accessed by software running on the PPC405EP processor through the use of **mtdcr** and **mfdcr** instructions.

Notes:

1. When peripheral bus boot is selected, peripheral bank 0 is automatically configured at reset to the address range listed above.
2. If PCI boot is selected, a PLB-to-PCI mapping is automatically configured at reset to the address range listed above.
3. After the boot process, software may reassign the boot memory regions for other uses.
4. All address ranges not listed above are reserved.

Notes:

1. DCR address space is addressable with up to 10 bits (1024 or 1K unique addresses). Each unique address represents a single 32-bit (word) register, or 1 kiloword (KW) (which equals 4 KB).

PowerPC 405EP Embedded Processor Data Sheet

On-Chip Memory (OCM)

The OCM feature comprises a memory controller and a one-port 4KB static RAM (SRAM) accessed by the processor core.

Features include:

- Low-latency access to critical instructions and data
- Performance identical to cache hits without misses
- Contents change only under program control

PLB to PCI Interface

The PLB to PCI interface core provides a mechanism for connecting PCI devices to the local PowerPC processor and local memory. This interface is compliant with version 2.2 of the PCI Specification.

Features include:

- Internal PCI bus arbiter for up to six external devices at PCI bus speeds up to 66MHz. Internal arbiter use is optional and can be disabled for systems which employ an external arbiter.
- PCI bus frequency up to 66MHz
 - Asynchronous operation from 1/8 PLB frequency to 66MHz maximum
- 32-bit PCI address/data bus
- Power Management:
 - PCI Bus Power Management v1.1 compliant
- Supports 1:1, 2:1, 3:1, 4:1 clock ratios from PLB to PCI
- Buffering between PLB and PCI:
 - PCI target 64-byte write post buffer
 - PCI target 96-byte read prefetch buffer
 - PLB slave 32-byte write post buffer
 - PLB slave 64-byte read prefetch buffer
- Error tracking/status
- Supports PCI target side configuration
- Supports processor access to all PCI address spaces:
 - Single-byte PCI I/O reads and writes
 - PCI memory single-beat and prefetch-burst reads and single-beat writes
 - Single-byte PCI configuration reads and writes (type 0 and type 1)
 - PCI interrupt acknowledge

PowerPC 405EP Embedded Processor Data Sheet

- PCI special cycle
- Supports PCI target access to all PLB address spaces
- Supports PowerPC processor boot from PCI memory

SDRAM Memory Controller

The PPC405EP Memory Controller core provides a low latency access path to SDRAM memory. A variety of system memory configurations are supported. The memory controller supports up to two physical banks. Up to 256MB per bank are supported, up to a maximum of 1 GB. Memory timings, address and bank sizes, and memory addressing modes are programmable.

Features include:

- 11x8 to 13x11 addressing for SDRAM (2 banks)
- 32-bit memory interface support
- Programmable address compare for each bank of memory
- Industry standard 168-pin DIMMS are supported (some configurations)
- Up to 133MHz memory with PC-133 support
 - 266MHz and 133MHz processors support 133MHz memory
 - 200MHz processors support 100 MHz memory
- 4MB to 256MB per bank
- Programmable address mapping and timing
- Auto refresh
- Page mode accesses with up to 4 open pages
- Power management (self-refresh)

External Peripheral Bus Controller (EBC)

- Supports five banks of ROM, EPROM, SRAM, Flash memory, or slave peripherals
- Up to 66MHz operation
- Burst and non-burst devices
- 8- and 16-bit byte-addressable data bus width support
- Latch data on Ready, synchronous or asynchronous
- Programmable 2K clock time-out counter with disable for Ready
- Programmable access timing per device
 - 0–255 wait states for non-bursting devices
 - 0–31 burst wait states for first access and up to 7 wait states for subsequent accesses

PowerPC 405EP Embedded Processor Data Sheet

- Programmable CSon, CSoff relative to address
- Programmable OEon, WEon, WEoff (0 to 3 clock cycles) relative to CS
- Programmable address mapping
- Peripheral Device pacing with external "Ready"

DMA Controller

- Supports memory-to-memory transfers
- Four channels
- Scatter/gather capability for programming multiple DMA operations
- 32-bit addressing
- Address increment or decrement
- Internal 32-byte data buffering capability

Serial Interface

- One 8-pin UART and one 2-pin (Tx and Rx only) UART interface provided
- Internal serial clock to allows a wide range of baud rates
- Register compatibility with NS16750 register set
- Complete status reporting capability
- Transmitter and receiver are each buffered with 16-byte FIFOs when in FIFO mode
- Fully programmable serial-interface characteristics
- Supports DMA using internal DMA engine

IIC Bus Interface

- Compliant with Phillips® Semiconductors I²C Specification, dated 1995
- Operation at 100kHz or 400kHz
- 8-bit data
- 10- or 7-bit address
- Slave transmitter and receiver
- Master transmitter and receiver
- Multiple bus masters
- Supports fixed V_{DD} IIC interface

PowerPC 405EP Embedded Processor Data Sheet

- Two independent 4 x 1 byte data buffers
- Twelve memory-mapped, fully programmable configuration registers
- One programmable interrupt request signal
- Provides full management of all IIC bus protocol
- Programmable error recovery

General Purpose IO (GPIO) Controller

- Controller functions and GPIO registers are programmed and accessed via memory-mapped OPB bus master accesses
- All GPIOs are pin-shared with other functions. DCRs control whether a particular pin that has GPIO capabilities acts as a GPIO or is used for another purpose.
- Each GPIO output is separately programmable to emulate an open-drain driver (i.e., drives to zero, three-stated if output bit is 1)

Universal Interrupt Controller (UIC)

The Universal Interrupt Controller (UIC) provides the control, status, and communications necessary between the various sources of interrupts and the local PowerPC processor.

Features include:

- Supports seven external and 19 internal interrupts
- Edge triggered or level-sensitive
- Positive or negative active
- Non-critical or critical interrupt to processor core
- Programmable critical interrupt priority ordering
- Programmable critical interrupt vector for faster vector processing

10/100 Mbps Ethernet MAC

- Two ports capable of handling full/half duplex 100Mbps and 10Mbps operation
- Uses the medium independent interface (MII) to the physical layer (PHY not included on chip)

JTAG

- IEEE 1149.1 test access port
- IBM RISCWatch debugger support
- JTAG Boundary Scan Description Language (BSDL)

Pin Lists

The PPC405EP embedded controller is available in a 31 millimeter, 385-ball E-PBGA package.

The following table lists all the external signals in alphabetical order and shows the ball (pin) number on which the signal appears. Multiplexed signals are shown with the default signal (following reset) *not* in brackets and the alternate signal in brackets. Multiplexed signals appear alphabetically multiple times in the list—once for each signal name on the ball. The page number listed gives the page in “Signal Functional Description” on page 33 where the signals in the indicated interface group begin.

PowerPC 405EP Embedded Processor Data Sheet

Signal List

The following table provides a summary of the number of package pins associated with each functional interface group.

Pin Summary

Group	No. of Pins
Non multiplexed	215
Multiplexed	33
Total Signal Pins	248
OV _{DD}	43
V _{DD}	16
Gnd	53
Thermal (and Gnd)	25
Reserved	0
Total Pins	385

In the table "Signal Functional Description" on page 33, each external signal is listed along with a short description of the signal function. Active-low signals (for example, RAS) are marked with an overline. Please see "Signals Listed Alphabetically" on page 13 for the pin (ball) number to which each signal is assigned.

Multiplexed Pins

Some signals are multiplexed on the same package pin (ball) so that the pin can be used for different functions. In most cases, the signal names shown in this table are not accompanied by signal names that may be multiplexed on the same pin. If you need to know what, if any, signals are multiplexed with a particular signal, look up the name in "Signals Listed Alphabetically" on page 13. It is expected that in any single application a particular pin will always be programmed to serve the same function. The flexibility of multiplexing allows a single chip to offer a richer pin selection than would otherwise be possible.

In addition to multiplexing, many pins are also multi-purpose. For example, in the PCI interface PCIC3:0/BE3:0 serves as both Command and Byte Enable signals. In this example, the pins are also bidirectional, serving as both inputs and outputs.

Initialization Strapping

One group of pins is used as strapped inputs during system reset. These pins function as strapped inputs only during reset and are used for other functions during normal operation (see "Initialization" on page 50). Note that the use of these pins for strapping is not considered multiplexing since the strapping function is not programmable.

Pull-Up and Pull-Down Resistors

Pull-up and pull-down resistors are used for strapping during reset and to retain unused or undriven inputs in an appropriate state. The recommended pull-up value of 3k Ω to +3.3V (10k Ω to +5V can be used on 5V tolerant I/Os) and pull-down value of 1k Ω to GND, applies only to individually terminated signals. To prevent possible damage to the device, I/Os capable of becoming outputs *must never* be tied together and terminated through a common resistor.

PowerPC 405EP Embedded Processor Data Sheet

If your system-level test methodology permits, input-only signals can be connected together and terminated through either a common resistor or directly to +3.3V or GND. When a resistor is used, its value must ensure that the grouped I/Os reach a valid logic zero or logic one state when accounting for the total input current into the PPC405EP.

Unused I/Os

Strapping of some pins may be necessary when they are unused. Although the PPC405EP requires only the pull-up and pull-down terminations as specified in the “Signal Functional Description” on page 33, good design practice is to terminate all unused inputs or to configure I/Os such that they always drive. If unused, the peripheral, SDRAM, and PCI buses should be configured and terminated as follows:

- Peripheral interface—PerAddr03:31, PerData00:15, and all of the control signals are driven by default. Terminate PerReady high.
- SDRAM—Program SDRAM0_CFG[EMDULR]=1 and SDRAM0_CFG[DCE]=1. This causes the PPC405EP to actively drive all of the SDRAM address, data, and control signals.
- PCI—The PCI pull-up requirements given in the Signal Functional Description apply only when the PCI interface is being used. When the PCI bridge is unused, configure the PCI controller to park on the bus and actively drive PCIAD31:00, PCIC3:0/BE3:0, and the remaining PCI control signals by doing the following:
 - Strap the PPC405EP to disable the internal PCI arbiter.
 - Individually connect $\overline{\text{PCISERR}}$, $\overline{\text{PCIPErr}}$, $\overline{\text{PCITRDY}}$, and $\overline{\text{PCIStop}}$ through 3.3k Ω resistors to +3.3V.
 - Terminate $\overline{\text{PCIReq1:2}}$ to +3.3V.
 - Terminate $\overline{\text{PCIReq0/Gnt}}$ to GND.

For selected interfaces, it is possible to turn off input receivers for some or all of the signals on that interface. Control for this receiver gating is in register CPC0_CR1. When this gating capability is applied to unused signals, it is not necessary to strap them. Refer to the *PowerPC 405EP Embedded Processor User's Manual* for details.

External Bus Control Signals

All peripheral bus control signals ($\overline{\text{PerCS0:4}}$, $\overline{\text{PerR/W}}$, $\overline{\text{PerWBE0:1}}$, $\overline{\text{PerOE}}$, $\overline{\text{PerWE}}$, $\overline{\text{PerBLast}}$) are set to the high-impedance state when ExtReset=0. In addition, as detailed in the *PowerPC 405EP Embedded Processor User's Manual*, the peripheral bus controller can be programmed via EBC0_CFG to float some of these control signals between transactions. As a result, a pull-up resistor should be added to those control signals where an undriven state may affect any devices receiving that particular signal.

The following table lists all of the I/O signals provided by the PPC405EP. Please refer to “Signals Listed Alphabetically” on page 13 for the pin number to which each signal is assigned.

PowerPC 405EP Embedded Processor Data Sheet

Signal Functional Description (Part 1 of 6)

Secondary multiplexed signals are shown in brackets.

Notes:

1. Receiver input has hysteresis.
2. Must pull up. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
3. Must pull down. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
4. If not used, must pull up.
5. If not used, must pull down.
6. Strapping input during reset; pull up or pull down as required.
7. Pull-up may be required. See "External Bus Control Signals" on page 32.

Signal Name	Description	I/O	Type	Notes
PCI Interface				
PCIAD31:00	PCI Address/Data Bus. Multiplexed address and data bus.	I/O	5V tolerant 3.3V PCI	
PCIC3:0/BE3:0	PCI bus command and byte enables.	I/O	5V tolerant 3.3V PCI	
PCIClk	PCIClk is used as the asynchronous PCI clock when in asynch mode.	I	5V tolerant 3.3V PCI	
PCIFrame	PCIFrame is driven by the current PCI bus master to indicate the beginning and duration of a PCI access.	I/O	5V tolerant 3.3V PCI	2
PCIParity	PCI parity. Parity is even across PCIAD00:31 and PCIC3:0/BE3:0. PCIParity is valid one cycle after either an address or data phase. The PCI device that drove PCIAD00:31 is responsible for driving PCIParity on the next PCI bus clock.	I/O	5V tolerant 3.3V PCI	
PCIIRDY	PCIIRDY is driven by the current PCI bus master. Assertion of PCIIRDY indicates that the PCI initiator is ready to transfer data.	I/O	5V tolerant 3.3V PCI	2
PCITRDY	The target of the current PCI transaction drives PCITRDY. Assertion of PCITRDY indicates that the PCI target is ready to transfer data.	I/O	5V tolerant 3.3V PCI	2
PCIStop	The target of the current PCI transaction can assert PCIStop to indicate to the requesting PCI master that it wants to end the current transaction.	I/O	5V tolerant 3.3V PCI	2
PCIDevSel	PCIDevSel is driven by the target of the current PCI transaction. A PCI target asserts PCIDevSel when it has decoded an address and command encoding and claims the transaction.	I/O	5V tolerant 3.3V PCI	2
PCIIDSel	PCIIDSel is used during configuration cycles to select the PCI slave interface for configuration.	I	5V tolerant 3.3V PCI	
PCIINT	PCI interrupt. Open-drain output (two states; 0 or open circuit) or Peripheral write enable. Low when any of the four PerWBE0:3 write byte enables are low.	O	5V tolerant 3.3V PCI	
PCISErr	PCISErr is used for reporting address parity errors or catastrophic failures detected by a PCI target.	I/O	5V tolerant 3.3V PCI	2
PCIPErr	PCIPErr is used for reporting data parity errors on PCI transactions. PCIPErr is driven active by the device receiving PCIAD00:31, PCIC3:0/BE3:0, and PCIParity, two PCI clocks following the data in which bad parity is detected.	I/O	5V tolerant 3.3V PCI	2
PCIReset	PCI specific reset.	O	5V tolerant 3.3V PCI	
PCIReq0/Gnt	Multipurpose signal, used as PCIReq0 when internal arbiter is used, and as Gnt when external arbiter is used.	I	5V tolerant 3.3V PCI	

PowerPC 405EP Embedded Processor Data Sheet

Signal Functional Description (Part 2 of 6)

Secondary multiplexed signals are shown in brackets.

Notes:

1. Receiver input has hysteresis.
2. Must pull up. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
3. Must pull down. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
4. If not used, must pull up.
5. If not used, must pull down.
6. Strapping input during reset; pull up or pull down as required.
7. Pull-up may be required. See "External Bus Control Signals" on page 32.

Signal Name	Description	I/O	Type	Notes
$\overline{\text{PCIReq}}_{1:2}$	$\overline{\text{PCIReq}}$ input when internal arbiter is used.	I	5V tolerant 3.3V PCI	
$\overline{\text{PCIGnt0/Req}}$	$\overline{\text{Gnt0}}$ when internal arbiter is used or $\overline{\text{Req}}$ when external arbiter is used.	O	5V tolerant 3.3V PCI	
$\overline{\text{PCIGnt1:2}}$	$\overline{\text{PCIGnt}}$ output when internal arbiter is used.	O	5V tolerant 3.3V PCI	
Ethernet Interface				
PHY0Rx0:1D3:0	Received data. This is a nibble wide bus from the PHY. The data is synchronous with the PHY0RxClk.	I	5V tolerant 3.3V LVTTTL	1
EMC0Tx0:1D3:0	Transmit data. A nibble wide data bus towards the net. The data is synchronous to the PHY0TxClk.	O	5V tolerant 3.3V LVTTTL	
PHY0Rx0:1Err	Receive Error. This signal comes from the PHY and is synchronous to the PHY0RxClk.	I	5V tolerant 3.3V LVTTTL	1
PHY0Rx0:1Clk	Receive Medium clock. This signal is generated by the PHY.	I	5V tolerant 3.3V LVTTTL	1
PHY0Rx0:1DV	Receive Data Valid. Data on the Data Bus is valid when this signal is activated. Deassertion of this signal indicates end of the frame reception.	I	5V tolerant 3.3V LVTTTL	1
PHY0CrS0:1	Carrier Sense signal from the PHY. This is an asynchronous signal.	I	5V tolerant 3.3V LVTTTL	1
EMC0Tx0:1Err	Transmit Error. This signal is generated by the Ethernet controller, is connected to the PHY and is synchronous with the PHYTxClk. It informs the PHY that an error was detected.	O	5V tolerant 3.3V LVTTTL	
EMC0Tx0:1En	Transmit Enable. This signal is driven by the EMAC to the PHY. Data is valid during the active state of this signal. Deassertion of this signal indicates end of frame transmission. This signal is synchronous to the PHY0TxClk.	O	5V tolerant 3.3V LVTTTL	
PHY0Tx0:1Clk	This clock comes from the PHY and is the Medium Transmit clock.	I	5V tolerant 3.3V LVTTTL	1
PHY0CoI0:1	Collision signal from the PHY. This is an asynchronous signal.	I	5V tolerant 3.3V LVTTTL	1
EMC0MDCIk	Management Data Clock. The MDCIk is sourced to the PHY. Management information is transferred synchronously with respect to this clock.	O	5V tolerant 3.3V LVTTTL	
EMC0MDIO	Management Data Input/Output is a bidirectional signal between the Ethernet controller and the PHY. It is used to transfer control and status information.	I/O	5V tolerant 3.3V LVTTTL	1

PowerPC 405EP Embedded Processor Data Sheet

Signal Functional Description (Part 3 of 6)

Secondary multiplexed signals are shown in brackets.

Notes:

1. Receiver input has hysteresis.
2. Must pull up. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
3. Must pull down. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
4. If not used, must pull up.
5. If not used, must pull down.
6. Strapping input during reset; pull up or pull down as required.
7. Pull-up may be required. See "External Bus Control Signals" on page 32.

Signal Name	Description	I/O	Type	Notes
SDRAM Interface				
MemData00:31	Memory data bus. Notes: 1. MemData00 is the most significant bit (msb). 2. MemData31 is the least significant bit (lsb).	I/O	3.3V LVTTTL	
MemAddr12:00	Memory address bus. Notes: 1. MemAddr12 is the most significant bit (msb). 2. MemAddr00 is the least significant bit (lsb).	O	3.3V LVTTTL	
BA1:0	Bank Address supporting up to 4 internal banks.	O	3.3V LVTTTL	
$\overline{\text{RAS}}$	Row Address Strobe.	O	3.3V LVTTTL	
$\overline{\text{CAS}}$	Column Address Strobe.	O	3.3V LVTTTL	
DQM0:3	DQM for byte lane: 0 (MemData00:7), 1 (MemData08:15), 2 (MemData16:23), and 3 (MemData24:31)	O	3.3V LVTTTL	
$\overline{\text{BankSel0:1}}$	Select up to two external SDRAM banks.	O	3.3V LVTTTL	
$\overline{\text{WE}}$	Write Enable.	O	3.3V LVTTTL	
ClkEn0:1	SDRAM Clock Enable.	O	3.3V LVTTTL	
MemClkOut0:1	Two copies of an SDRAM clock allows, in some cases, glueless SDRAM attach without requiring this signal to be repowered by a PLL or zero-delay buffer.	O	3.3V LVTTTL	
External Slave Peripheral Interface				
PerData00:15	Peripheral data bus. Note: PerData00 is the most significant bit (msb) on this bus.	I/O	5V tolerant 3.3V LVTTTL	1
PerAddr03:05 PerAddr06:31	Peripheral address bus. Note: PerAddr03 is the most significant bit (msb) on this bus.	I/O	5V tolerant 3.3V LVTTTL	1
$\overline{\text{PerWBE0:1}}$	These pins act as byte-enables which are valid for an entire cycle or as write-byte-enables which are valid for each byte on each data transfer, allowing partial word transactions.	O	5V tolerant 3.3V LVTTTL	7
[$\overline{\text{PerWE}}$]	Peripheral write enable. Low when either of the two $\overline{\text{PerWBE0:1}}$ write byte enables are low. To access this function, software must toggle a DCR bit.	O	5V tolerant 3.3V LVTTTL	
$\overline{\text{PerCS0}}$	Peripheral chip select bank 0.	O	5V tolerant 3.3V LVTTTL	7
[$\overline{\text{PerCS1:4}}$]	Four additional peripheral chip selects To access this function, software must toggle a DCR bit.	O	5V tolerant 3.3V LVTTTL	1, 7

PowerPC 405EP Embedded Processor Data Sheet

Signal Functional Description (Part 4 of 6)

Secondary multiplexed signals are shown in brackets.

Notes:

1. Receiver input has hysteresis.
2. Must pull up. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
3. Must pull down. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
4. If not used, must pull up.
5. If not used, must pull down.
6. Strapping input during reset; pull up or pull down as required.
7. Pull-up may be required. See "External Bus Control Signals" on page 32.

Signal Name	Description	I/O	Type	Notes
$\overline{\text{PerOE}}$	Peripheral output enable.	O	5V tolerant 3.3V LVTTTL	7
$\text{PerR}/\overline{\text{W}}$	Peripheral read/write. High indicates a read from memory, low indicates a write to memory.	O	5V tolerant 3.3V LVTTTL	
PerReady	Ready to transfer data.	I	5V tolerant 3.3V LVTTTL	1
$[\overline{\text{PerBLast}}]$	Used to indicates the last transfer of a memory access. To access this function, software must toggle a DCR bit.	I/O	5V tolerant 3.3V LVTTTL	1, 7
PerClk	Peripheral clock to be used by peripheral slaves.	O	5V tolerant 3.3V LVTTTL	
$\overline{\text{ExtReset}}$	Peripheral reset to be used by peripheral slaves.	O	5V tolerant 3.3V LVTTTL	

Internal Peripheral Interface

UART0_Rx	UART0 Serial Data In.	I	5V tolerant 3.3V LVTTTL	1
UART0_Tx	UART0 Serial Data Out.	O	5V tolerant 3.3V LVTTTL	6
$[\overline{\text{UART0_DCD}}]$	UART0 Data Carrier Detect. To access this function, software must toggle a DCR bit.	I	5V tolerant 3.3V LVTTTL	1
$[\overline{\text{UART0_DSR}}]$	UART0 Data Set Ready. To access this function, software must toggle a DCR bit.	I	5V tolerant 3.3V LVTTTL	1
$\overline{\text{UART0_CTS}}$	UART0 Clear To Send.	I	5V tolerant 3.3V LVTTTL	1
$[\overline{\text{UART0_DTR}}]$	UART0 Data Terminal Ready. To access this function, software must toggle a DCR bit.	O	5V tolerant 3.3V LVTTTL	
$\overline{\text{UART0_RTS}}$	UART0 Request To Send.	O	5V tolerant 3.3V LVTTTL	6
$[\overline{\text{UART0_RI}}]$	UART0 Ring Indicator. To access this function, software must toggle a DCR bit.	I	5V tolerant 3.3V LVTTTL	1
$[\text{UART1_Rx}]$	UART1 Serial Data In. To access this function, software must toggle a DCR bit.	I	5V tolerant 3.3V LVTTTL	1
$[\text{UART1_Tx}]$	UART1 Serial Data Out. To access this function, software must toggle a DCR bit.	O	5V tolerant 3.3V LVTTTL	
IIC_SCL	IIC Serial Clock.	I/O	3.3V IIC	1, 2
IIC_SDA	IIC Serial Data.	I/O	3.3V IIC	1, 2

Interrupts Interface

$[\text{IRQ0:6}]$	Interrupt requests To access this function, software must toggle a DCR bit.	I	5V tolerant 3.3V LVTTTL	1
-------------------	--	---	----------------------------	---

Signal Functional Description (Part 5 of 6)

Secondary multiplexed signals are shown in brackets.

Notes:

1. Receiver input has hysteresis.
2. Must pull up. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
3. Must pull down. See "Pull-Up and Pull-Down Resistors" on page 31 for recommended termination values.
4. If not used, must pull up.
5. If not used, must pull down.
6. Strapping input during reset; pull up or pull down as required.
7. Pull-up may be required. See "External Bus Control Signals" on page 32.

Signal Name	Description	I/O	Type	Notes
JTAG Interface				
TDI	Test data in.	I	5V tolerant 3.3V LVTTTL	1, 4
TMS	JTAG test mode select.	I	5V tolerant 3.3V LVTTTL	1, 4
TDO	Test data out.	O	5V tolerant 3.3V LVTTTL	
TCK	JTAG test clock. The frequency of this input can range from DC to 25MHz.	I	5V tolerant 3.3V LVTTTL	1, 4
$\overline{\text{TRST}}$	JTAG reset. $\overline{\text{TRST}}$ must be low at power-on to initialize the JTAG controller and for normal operation of the PPC405EP.	I	5V tolerant 3.3V LVTTTL	5
System Interface				
$\overline{\text{SysReset}}$	Main system reset. External logic can drive this bidirectional pin low (minimum of 16 cycles) to initiate a system reset. A system reset can also be initiated by software. Implemented as an open-drain output (two states; 0 or open circuit).	I/O	5V tolerant 3.3V LVTTTL	1, 2
SysErr	Set to 1 when a Machine Check is generated.	O	5V tolerant 3.3V LVTTTL	6
$\overline{\text{Halt}}$	Halt from external debugger.	I	5V tolerant 3.3V LVTTTL	1, 2
GPIO00:31	General Purpose I/O. All of the GPIO signals are multiplexed with other signals.	I/O	5V tolerant 3.3V LVTTTL	1
$\overline{\text{TestEn}}$	Test Enable. Used only for manufacturing tests. Pull down for normal operation.	I	1.8V CMOS w/pull-down	
SysClk	Main system clock input.	I	3.3V LVTTTL	
[RejectPkt0:1]	External request to reject a packet.	I	5V tolerant 3.3V LVTTTL	
AV _{DD}	Clean voltage input for the PLL.	I		
AGND	Clean Ground input for the PLL.	I

Absolute Maximum Ratings

The absolute maximum ratings below are stress ratings only. *Operation at or beyond these maximum ratings can cause permanent damage to the device. None of the performance specification contained in this document are guaranteed when operating at these maximum ratings.*

Characteristic	Symbol	Value	Unit
Supply Voltage (Internal Logic)	V_{DD}	0 to +1.95	V
Supply Voltage (I/O Interface)	OV_{DD}	0 to +3.6	V
PLL Supply Voltage	AV_{DD}	0 to +1.95	V
Input Voltage (1.8V CMOS receivers)	V_{IN}	0 to +1.95	V
Input Voltage (3.3V LVTTL receivers)	V_{IN}	0 to +3.6	V
Input Voltage (5.0V LVTTL receivers)	V_{IN}	0 to +5.5	V
Storage Temperature Range	T_{STG}	-55 to +150	°C
Case temperature under bias	T_C	-40 to +120	°C

Note: All specified voltages are with respect to GND.

Package Thermal Specifications

The PPC405EP is designed to operate within a case temperature range of -40°C to +85°C. Thermal resistance values for the E-PBGA packages in a convection environment are as follows:

Package—Thermal Resistance	Symbol	Airflow ft/min (m/sec)			Unit
		0 (0)	100 (0.51)	200 (1.02)	
31 mm, 385-balls—Junction-to-Case	θ_{JC}	2	2	2	°C/W
31 mm, 385-balls—Case-to-Ambient ¹	θ_{CA}	17.8	16.8	16.1	°C/W

Note:

- For a chip mounted on a JEDEC 2S2P card without a heat sink.
- For a chip mounted on a card with at least one signal and two power planes, the following relationships exist:
 - Case temperature, T_C , is measured at top center of case surface with device soldered to circuit board.
 - $T_A = T_C - P \times \theta_{CA}$, where T_A is ambient temperature and P is power consumption.
 - $T_{CMax} = T_{JMax} - P \times \theta_{JC}$, where T_{JMax} is maximum junction temperature and P is power consumption.

PowerPC 405EP Embedded Processor Data Sheet

Recommended DC Operating Conditions

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Notes:

1. PCI drivers meet PCI specifications.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Logic Supply Voltage	V_{DD}	+1.65	+1.8	+1.95	V	
I/O Supply Voltage	OV_{DD}	+3.0	+3.3	+3.6	V	
PLL Supply Voltage	AV_{DD}	+1.65	+1.8	+1.95	V	
Input Logic High (1.8V CMOS receivers)	V_{IH}	$0.65V_{DD}$		V_{DD}	V	
Input Logic High (3.3V PCI receivers)	V_{IH}	$0.5OV_{DD}$		$OV_{DD}+0.5$	V	
Input Logic High (3.3V LVTTL, 5V tolerant receivers)	V_{IH}	+2.0		+5.5	V	
Input Logic Low (1.8V CMOS receivers)	V_{IL}	0		$0.65V_{DD}$	V	
Input Logic Low (3.3V PCI receivers)	V_{IL}	-0.5		$0.35OV_{DD}$	V	
Input Logic Low (3.3V LVTTL, 5V tolerant receivers)	V_{IL}	0		+0.8	V	
Output Logic High (3.3V PCI receivers)	V_{OH}	$0.9OV_{DD}$		OV_{DD}	V	
Output Logic High (3.3V LVTTL, 5V tolerant receivers)	V_{OH}	+2.4		OV_{DD}	V	
Output Logic Low (3.3V PCI receivers)	V_{OL}	-0.5		$0.35OV_{DD}$	V	
Output Logic Low (3.3V LVTTL, 5V tolerant receivers)	V_{OL}	0		+0.4	V	
Input Leakage Current (no pull-up or pull-down)	I_{IL1}	0		0	μA	
Input Leakage Current (with internal pull-down)	I_{IL2}	0		200	μA	
5V Tolerant I/O Input Current ¹	I_{IL4}	± 10		-325	μA	
Input Max Allowable Overshoot (1.8V CMOS receivers)	$V_{IMAO1.8}$			$V_{DD} + 0.6$	V	
Input Max Allowable Overshoot (3.3V LVTTL, 5V tolerant receivers)	V_{IMAO}			+5.5	V	
Input Max Allowable Undershoot (3.3V LVTTL, 5V tolerant receivers)	V_{IMAU}	-0.6			V	
Output Max Allowable Overshoot (3.3V LVTTL, 5V tolerant receivers)	V_{OMAO}			+5.5	V	
Output Max Allowable Undershoot (3.3V LVTTL, 5V tolerant receivers)	V_{OMAU}	-0.6			V	
Case Temperature	T_C	-40		+85	$^{\circ}C$	

Note:

1. See "5V-Tolerant Input Current" on page 41

PowerPC 405EP Embedded Processor Data Sheet

5V-Tolerant Input Current

Input Capacitance

Parameter	Symbol	Maximum	Unit	Notes
3.3V LVTTL I/O	C_{IN1}	12	pF	
5V tolerant, 3.3V LVTTL I/O	C_{IN2}	12	pF	
PCI I/O	C_{IN3}	12	pF	
Rx only pins	C_{IN4}	9	pF	
IIC pads	C_{IN5}	6.7	pF	

PowerPC 405EP Embedded Processor Data Sheet

DC Electrical Characteristics

Parameter	Symbol	Minimum	Typical	Maximum	Unit
Active Operating Current (V_{DD})	I_{DD}	440	520	606	mA
Active Operating Current (OV_{DD})	I_{ODD}	59	70	81	mA
Active Operating Current (AV_{DD})	I_{ADD}	14	17	19	mA
Total Power	P_T		1.2	1.4	W

Note:

1. AV_{DD} should be derived from V_{DD} using the following circuit:

L1 – 2.2μH SMT inductor (equivalent to MuRata LQH3C2R2M34) or SMT chip ferrite bead (equivalent to MuRata BLM31A700S)

C1 – 3.3 μF SMT tantalum

C2 – 0.1 μF SMT monolithic ceramic capacitor with X7R dielectric or equivalent

C3 – 0.01 μF SMT monolithic ceramic capacitor with X7R dielectric or equivalent

Test Conditions

Clock timing and switching characteristics are specified in accordance with operating conditions shown in the table “Recommended DC Operating Conditions.” For all signals other than PCI signals, AC specifications are characterized at $OV_{DD} = 3V$ and $T_C = 85^\circ C$ with the 50pF test load shown in the figure at right.

For PCI signals there are two different test load circuits, one for the rising edge and one the falling edge as shown in the figures at right.

PowerPC 405EP Embedded Processor Data Sheet

Clocking Specifications

Symbol	Parameter	Min	Max	Units
CPU				
PF_C	Processor clock frequency		133.33 or 200 or 266.66	MHz
PT_C	Processor clock period	7.5 or 5 or 3.75		ns
SysClk Input				
F_C	Frequency	25	100	MHz
T_C	Period	10	40	ns
T_{CS}	Edge stability (phase jitter, cycle to cycle)	—	± 0.15	ns
T_{CH}	Input high time	40% of nominal period	60% of nominal period	ns
T_{CL}	Input low time	40% of nominal period	60% of nominal period	ns
Note: Input slew rate > 2V/ns				
MemClkOut Output				
F_C	Frequency		133	MHz
T_C	Period	7.50		ns
T_{CS}	Edge stability (phase jitter, cycle to cycle)	—	± 0.2	ns
T_{CH}	Output high time	45% of nominal period	55% of nominal period	ns
T_{CL}	Output low time	45% of nominal period	55% of nominal period	ns
TrcClk Output				
F_C	Clock output frequency		$PF_C / 2$	MHz
T_C	Clock period		$PT_C \times 2$	ns
T_{CS}	Clock edge stability (phase jitter, cycle to cycle)		± 0.2	ns
T_{CH}	Clock output high time	45% of nominal period	55% of nominal period	ns
T_{CL}	Clock output low time	45% of nominal period	55% of nominal period	ns
Other Clocks				
$VCOF_C$	VCO frequency @ $PF_C = 133$ or 200 or 266MHz	500	1000	MHz
$PLBF_C$	PLB frequency @ $PF_C = 133$ or 266MHz		133.33	MHz
$PLBF_C$	PLB frequency @ $PF_C = 200$ MHz		100	MHz
$OPBF_C$	OPB frequency @ $PF_C = 133$ or 266MHz		66.66	MHz
$OPBF_C$	OPB frequency @ $PF_C = 200$ MHz		50	MHz

Clocking Waveform

PowerPC 405EP Embedded Processor Data Sheet

Spread Spectrum Clocking

Care must be taken when using a spread spectrum clock generator (SSCG) with the PPC405EP. This controller uses a PLL for clock generation inside the chip. The accuracy with which the PLL follows the SSCG is referred to as tracking skew. The PLL bandwidth and phase angle determine how much tracking skew there is between the SSCG and the PLL for a given frequency deviation and modulation frequency. When using an SSCG with the PPC405EP the following conditions must be met:

- The frequency deviation must not violate the minimum clock cycle time. Therefore, when operating the PPC405EP with one or more internal clocks at their maximum supported frequency, the SSCG can only lower the frequency.
- The maximum frequency deviation cannot exceed -3% , and the modulation frequency cannot exceed 40kHz. In some cases, on-board PPC405EP peripherals impose more stringent requirements (see Note 1).
- Use the peripheral bus clock (PerClk) for logic that is synchronous to the peripheral bus since this clock tracks the modulation.
- Use the SDRAM MemClkOut since it also tracks the modulation.

Notes:

1. The serial port baud rates are synchronous to the modulated clock. The serial port has a tolerance of approximately 1.5% on baud rate before framing errors begin to occur. The 1.5% tolerance assumes that the connected device is running at precise baud rates. If an external serial clock is used the baud rate is unaffected by the modulation
2. Operation of the PPC405EP PCI Bridge is unaffected by the use of an SSCG.

The PCI controller must be operated in asynchronous mode. When in asynchronous mode, the PCI bus clock must be driven into the PPC405EP PCIClk input. In this configuration the PCI controller supports the 66.66 MHz PCI clock specification which specifies a maximum frequency deviation of -1% at a modulation of between 30 kHz and 33 kHz.

3. Ethernet operation is unaffected.
4. IIC operation is unaffected.

Caution: It is up to the system designer to ensure that any SSCG used with the PPC405EP meets the above requirements and does not adversely affect other aspects of the system.

PowerPC 405EP Embedded Processor Data Sheet

Peripheral Interface Clock Timings

Parameter	Min	Max	Units
PCIClk input frequency (asynchronous mode)	Note 1	66.66	MHz
PCIClk period (asynchronous mode)	15	Note 1	ns
PCIClk input high time	40% of nominal period	60% of nominal period	ns
PCIClk input low time	40% of nominal period	60% of nominal period	ns
EMC0MDClk output frequency	—	2.5	MHz
EMC0MDClk period	400	—	ns
EMC0MDClk output high time	160	—	ns
EMC0MDClk output low time	160	—	ns
PHY0Tx0:1Clk input frequency	2.5	25	MHz
PHY0Tx0:1Clk period	40	400	ns
PHY0Tx0:1Clk input high time	35% of nominal period	—	ns
PHY0Tx0:1Clk input low time	35% of nominal period	—	ns
PHY0Rx0:1Clk input frequency	2.5	25	MHz
PHY0Rx0:1Clk period	40	400	ns
PHY0Rx0:1Clk input high time	35% of nominal period	—	ns
PHY0Rx0:1Clk input low time	35% of nominal period	—	ns
PerClk output frequency	—	66.66	MHz
PerClk period	15	—	ns
PerClk output high time	45% of nominal period	55% of nominal period	ns
PerClk output low time	45% of nominal period	55% of nominal period	ns
PerClk clock edge stability (phase jitter, cycle to cycle)		± 0.3	ns

Note:

1. In asynchronous PCI mode the minimum PCIClk frequency is 1/8 the PLB Clock. Refer to the *PowerPC 405EP Embedded Processor User's Manual* for more information.

Input Setup and Hold Timing Waveform

Output Delay and Float Timing Waveform

PowerPC 405EP Embedded Processor Data Sheet

Notes: 1. In the following I/O Specifications tables a timing value of na means “not applicable” and dc means “don’t care.”
2. See “Test Conditions” on page 42 for output capacitive loading.

I/O Specifications—Group 1 (Part 1 of 2)

Notes:

1. PCI timings are for asynchronous operation up to 66.66MHz. PCI output hold time requirement is 1 ns for 66.66MHz and 2ns for 33.33MHz.
2. Ethernet interface meets timing requirements as defined by IEEE 802.3 standard. Timing shown is with EMAC noise filter selected. See the CPC0_EPCTL register *PowerPC 405EP Embedded Processor User's Manual*.
3. For PCI, I/O H is specified at 0.9OV_{DD} and I/O L is specified at 0.1OV_{DD}. For all other interfaces, I/O H is specified at 2.4 V and I/O L is specified at 0.4 V.

PowerPC 405EP Embedded Processor Data Sheet

I/O Specifications—Group 2

Notes:

1. The SDRAM command interface is configurable through SDRAM0_TR[LDF] to provide a 2 to 4 cycle delay before the command is used by SDRAM.
2. SDRAM I/O timings are specified relative to a MemClkOut terminated into a lumped 10pF load.
3. SDRAM interface hold times are guaranteed at the PPC405EP package pin. System designers must use the PPC405EP IBIS model (available from www.chips.ibm.com) to ensure their clock distribution topology minimizes loading and reflections, and that the relative delays on clock wiring do not exceed the delays on other SDRAM signal wiring.
4. PerClk rising edge at package pin with a 10pF load trails the internal PLB clock by approximately 0.8ns.
5. I/O H is specified at 2.4 V and I/O L is specified at 0.4 V.

Signal	Input (ns)		Output (ns)		Output Current (mA)		Clock	Notes

PowerPC 405EP Embedded Processor Data Sheet

Initialization

The following describes the method by which initial chip settings are established when a system reset occurs.

Strapping

When the $\overline{\text{SysReset}}$ input is driven low (system reset), the state of certain I/O pins is read to enable default initial conditions prior to PPC405EP start-up. The actual capture instant is the nearest system clock edge before the deassertion of reset. These pins must be strapped using external pull-up (logical 1) or pull-down (logical 0) resistors to select the desired default conditions. The recommended pull-up is 3k Ω to +3.3V or 10k Ω to +5V. The recommended pull-down is 1K Ω to GND. These pins are use for strap functions only during reset. They are used for other signals during normal operation. The following table lists the strapping pins along with their functions and strapping options. The signal names assigned to the pins for normal operation appear below the pin number.

Strapping Pin Assignments

Function	Option	Ball Strapping	
IIC EEPROM controller If the controller is enabled, 32 bytes of configuration data are read from the EEPROM.		P04 UART0_Tx	
	Disable	0	
	Enable	1	
EEPROM address (P04 = 1) or Boot ROM width (P04 = 0)		N02 $\overline{\text{UART0_RTS}}$	Y17 SysErr
When P04 = 1, these pins set the high-order two bits of the EEPROM base address.	High order EEPROM base address bits	Address bit	Address bit
When P04 = 0, these pins indicated the width of the boot ROM.	8 bits	0	0
	16 bits	0	1
	reserved	1	0
	reserved	1	1

EEPROM

During reset, configuration values other than the internal default values can be read from a serial EEPROM connected to the IIC port. The association of bits in the EEPROM with the configuration values and their default values are covered in detail in the *PowerPC 405EP Embedded Processor User's Manual*.

Caution: If P04 is strapped to 1, and the EEPROM is not connected or is defective, the PPC405EP remains in the reset state and will not boot.

Revision Log

Date	Contents of Modification
01/30/2003	Add revision log.
03/18/2003	Update revision level of chip.
